

COMBINATION OF PAROXETINE AND 2-METHOXY-5-(5-TRIFLUOROMETHYL-TETRAZOL-1-YL-BENZYL)-(2S-PHENYL-PIPERIDIN-3S-YL)-AMINE FOR TREATMENT OF DEPRESSION AND/OR ANXIETY

5 The present invention relates to therapeutic combinations comprising paroxetine or physiologically acceptable salts or solvates thereof and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, to pharmaceutical compositions containing said combinations and their use in the treatment of depression and /or anxiety.

10 Paroxetine ((-) trans-4-(4'-fluorophenyl)3-(3'-4'-methylenedioxyphenoxy)methyl) piperidine) and its salts are commercially available and approved for use in humans for treatment and prophylaxis of, *inter alia*, anxiety, depression, obsessive compulsive disorder (OCD), premenstrual dysphoric disorder(PMDD)and panic disorders.

15 2-Methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, which is described in WO 95/08549, is a NK₁ receptor antagonist.

20 NK₁ receptor antagonists are known to be useful in the treatment of anxiety and depression, chemotherapy-induced nausea and vomiting and post-operative nausea and vomiting. Preclinical data suggest that NK₁ receptor antagonists may be useful in a variety of other disorders including pain, inflammatory diseases, allergic disorders, CNS disorders, skin disorders, cough and gastrointestinal disorders.

25 US 6117855 describes the use of a CNS-penetrant NK₁ receptor antagonist together with antidepressant or anti-anxiety drug for the manufacture of a medicament for the treatment or prevention of depression and/or anxiety.

There is however no specific disclosure of such combinations with paroxetine.

30 It has now been found that, surprisingly, therapeutic compositions comprising a combination of paroxetine or physiologically acceptable salts or solvates thereof and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, show surprising and synergistic levels of efficacy for the treatment and/or prophylaxis of depression and/or anxiety.

35 In particular, it has now been found that by combining paroxetine or physiologically acceptable salts or solvates thereof and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates

thereof a significantly greater antidepressant activity and/or anxiolytic activity than either of the two individual components taken alone is achieved.

5 It is a feature of this invention that the use of such a combination will provide one or more of the following effects: a more efficacious anti-depressive and/or anti-anxiety drug and/or a better tolerated drug treatment and/or drug with a more rapid onset of the anti-depressive and/or anti-anxiety activity.

Furthermore, the synergistic effect of the combination of the present invention allows a better management of any potential drug-related side effects.

10 According to one aspect of the invention, there is provided a combination comprising paroxetine or physiologically acceptable salts or solvates thereof and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof.

15 In a preferred aspect of the invention, each component may be employed in the combination in a dosage which is less than that normally expected to produce a fully effective therapeutic response when each component is administered alone.

20 Thus, in a preferred embodiment of the invention there is provided a therapeutically effective combination comprising a therapeutically non-effective dose of paroxetine or physiologically acceptable salts or solvates thereof and a therapeutically non-effective dose of 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof.

25 When used in any of the contexts or aspects of the present invention a therapeutically non-effective dose refers to a dosage of each component of the combination which is lower than normally expected to produce effective therapeutic response when each component is administered alone.

30 When used in any of the contexts or aspects of the present invention, paroxetine or physiologically acceptable salts or solvates thereof, may be administered as the free base, or in the form of any physiologically acceptable salt thereof, including all hydrated or anhydrous forms and all polymorphic forms of such salts. In particular, references to
35 paroxetine or physiologically acceptable salts or solvates thereof, include, without

limitation, paroxetine hydrochloride, paroxetine hydrochloride hemihydrate, paroxetine hydrochloride anhydrate, paroxetine mesylate and all polymorphic forms thereof.

Paroxetine is preferably used in the form of its hydrochloride hemihydrate salt.

5

Suitable pharmaceutically acceptable salts of 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine include acid addition salts formed with pharmaceutically acceptable organic or inorganic acids, for example hydrochlorides, hydrobromides, sulphates, alkyl- or arylsulphonates (e.g. methanesulphonates or p-toluenesulphonates), phosphates, acetates, citrates, succinates, tartrates, fumarates and maleates.

10

2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine is preferably used in the form of its dihydrochloride salt.

15

The dosage amount of a combination of paroxetine or physiologically acceptable salts or solvates thereof and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof required to be effective as an antidepressive and/or anti-anxiety drug may, of course, vary and is ultimately at the discretion of the medical practitioner. The factors to be considered include the route of administration and nature of the formulation, the subject mammal's body weight, age and general condition and the nature and severity of the condition to be treated.

20

In general, a suitable dose of paroxetine or physiologically acceptable salts or solvates thereof for administration to a human for the treatment of depression and/or anxiety as a single therapy may be in a dose in the range of 20 to 400 mg per day (measured as the free base) Paroxetine is advantageously administered by oral route once a day.

25

According to the present invention a suitable dose of paroxetine or physiologically acceptable salts or solvates thereof for administration in combination with 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine to a human for the treatment of depression and/or anxiety may be within the single therapy effective dose range. In a preferred aspect of the invention, the dose of paroxetine or physiologically acceptable salts or solvates thereof administered in combination with 2-methoxy-5-(5-

30

35

trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof may surprisingly be lower than the single therapy dose. In particular a therapeutically non-effective dose of paroxetine or physiologically acceptable salts or solvates thereof for administration in combination may be in the range
5 from 1 to 10 mg per day (measured as the free base) , preferably from 3.5 to 7.5 mg per day.

A suitable dose of 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof for
10 administration to a human as a single therapy may be in the range of 8 to 20mg per day, In a preferred aspect of the invention, the dose of 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof administered in combination with paroxetine or physiologically acceptable salts or solvates thereof may surprisingly be lower than the normal single therapy dose.
15 In particular, a therapeutically non-effective dose of 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof may be in the range from 1 to 5 mg(measured as the free base) per day, preferably from 1 to 3 mg per day and more preferably from 1 to 2.5 mg per day.

20 A combination according to the invention conveniently comprises paroxetine or physiologically acceptable salts or solvates thereof, (measured as the free base) in an amount from 1 mg to 10 mg, more particularly in an amount from 3.5 mg to 7.5 mg, and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, in an amount from 1 mg to 5 mg
25 (measured as the free base) and particularly in an amount from 1 mg to 3 mg and more particularly in an amount from 1 to 2.5 mg.

A preferred combination according to the invention comprises paroxetine or physiologically acceptable salts or solvates thereof, in an amount from 1 to 10 mg
30 (measured as the free base) and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, in an amount from 1 to 5 mg (measured as the free base).

A preferred combination according to the invention comprises paroxetine or
35 physiologically acceptable salts or solvates thereof, in an amount from 1 to 10 mg (measured as the free base) and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-

phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, in an amount from 1 to 3 mg (measured as the free base).

5 A preferred combination according to the invention comprises paroxetine or physiologically acceptable salts or solvates thereof, in an amount from 1 to 10 mg (measured as the free base) and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, in an amount from 1 to 2.5 mg (measured as the free base).

10 A preferred combination according to the invention comprises paroxetine or physiologically acceptable salts or solvates thereof, in an amount from 3.5 to 7.5 mg (measured as the free base) and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, in an amount from 1 to 5 mg (measured as the free base).

15 A preferred combination according to the invention comprises paroxetine or physiologically acceptable salts or solvates thereof, in an amount from 3.5 to 7.5 mg (measured as the free base) and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, in an amount from 1 to 3 mg (measured as the free base).

20 A preferred combination according to the invention comprises paroxetine or physiologically acceptable salts or solvates thereof, in an amount from 3.5 to 7.5 mg (measured as the free base) and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, in an amount from 1 to 2.5 mg (measured as the free base).

25 The present invention thus provides a method for the treatment of depression and/or anxiety in a mammal including a human, which comprises treating said animal with a therapeutically effective amount of a combination comprising paroxetine or physiologically acceptable salts or solvates thereof and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof.

30 In a preferred embodiment the present invention provides a method for the treatment of depression and/or anxiety in a mammal including a human, which comprises treating said

animal with a therapeutically effective amount of a combination comprising a therapeutically non-effective dose of paroxetine or physiologically acceptable salts or solvates thereof and a therapeutically non-effective dose of 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof.

In a further preferred aspect, the present invention provides a method for the treatment of depression and/or anxiety in a mammal including a human, which comprises treating said mammal with a therapeutically effective amount of a combination comprising a therapeutically non-effective dose of paroxetine and a therapeutically non-effective dose of 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine dihydrochloride.

In a further preferred aspect, the present invention provides a method for the treatment of depression and/or anxiety in a mammal including a human, which comprises treating said mammal with a therapeutically effective amount of a combination comprising a therapeutically non-effective dose of paroxetine hydrochloride and a therapeutically non-effective dose of 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine dihydrochloride.

In a further preferred aspect, the present invention provides a method for the treatment of depression and/or anxiety in a mammal including a human, which comprises treating said mammal with a therapeutically effective amount of a combination comprising a therapeutically non-effective dose of paroxetine hydrochloride hemihydrate and a therapeutically non-effective dose of 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine dihydrochloride .

In a further preferred aspect, the present invention provides a method for the treatment of depression and/or anxiety in a mammal including a human, which comprises treating said mammal with a therapeutically effective amount of a combination comprising a therapeutically non-effective dose of paroxetine hydrochloride anhydrate and a therapeutically non-effective dose of 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine dihydrochloride.

In a further preferred aspect, the present invention provides a method for the treatment of depression and/or anxiety in a mammal including a human, which comprises treating said

mammal with a therapeutically effective amount of a combination comprising a therapeutically non-effective dose of paroxetine mesylate and a therapeutically non-effective dose of 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine dihydrochloride.

5

Reference herein to treatment extends to prophylaxis as well as to treatment of established depression and/or anxiety symptoms.

10 As used herein, the term depression includes depressive mood episodes, depressive disorders, bipolar disorders, other mood, psychotic, adjustment disorders premenstrual and dysphroic disorder(PMDD). Thus, for example, depressive mood episodes include major depressive episodes and mixed episodes. Depressive disorders include Major Depressive Disorder (MDD) single or recurrent episode (with or without psychotic features, catatonic features, melancholic features, atypical features, anxious depression, 15 or postpartum onset), dysthymic disorder (with early or late onset and with or without atypical features) and depressive disorder not otherwise specified. Bipolar disorders include bipolar I and II disorders, cyclothymic disorder and bipolar disorder not otherwise specified. Other mood, psychotic and adjustment disorders include neurotic depression; mood disorders due to general medical conditions including, but not limited to, myocardial 20 infarction, diabetes, miscarriage, abortion, premenstrual dysphroic disorders(PMDD), dementia of the Alzheimer's type (with early or late onset) with depressed mood, vascular dementia with depressed mood; substance-induced mood disorders including, but not limited to, depression induced by alcohol, amphetamines, cocaine, hallucinogens, inhalants, opioids, phencyclidines, sedatives, hypnotics, anxiolytics and other substances; 25 schizoaffective disorder of the depressed type; adjustment disorder with depressed mood; adjustment disorder with mixed anxiety and depressed mood.

30 As used herein, the term anxiety includes panic attacks, agoraphobia, anxiety disorders, adjustment disorders, separation anxiety disorder and premenstrual dysphroic disorder(PMDD). Thus, for example, anxiety disorders include panic disorder with or without agoraphobia, agoraphobia without a history of panic disorder, specific phobia, social phobia (social anxiety disorder), obsessive-compulsive disorder, Acute and posttraumatic stress disorders, generalised anxiety disorders, anxiety disorder due to a general medical condition, substance-Induced anxiety disorder, anxiety disorder not 35 otherwise specified and mixed anxiety-depression disorders. Adjustment disorders include

adjustment disorder with anxiety and adjustment disorder with mixed anxiety and depressed mood.

The advantageous profile of anti-anxiety activity obtained by the administration of a therapeutically non-effective dose of paroxetine or physiologically acceptable salts or solvates thereof with a therapeutically non-effective dose of 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or a physiologically acceptable salt or solvate thereof can be demonstrated in the gerbil social interaction model, according to the method described by Cheeta et al. (Cheeta S. et al., 2001. Brain Research 915: 170-175).

It will be appreciated that the compounds of the combination may be administered simultaneously, either in the same or different pharmaceutical formulations, or sequentially. If there is sequential administration, the delay in administering the second and any subsequent active ingredient should not be such as to lose the benefit of a synergistic therapeutic effect of the combination of the active ingredients. It will also be understood that the compounds of the combination or the physiologically functional derivatives of any thereof, whether presented simultaneously or sequentially, may be administered individually or in multiples or in any combination thereof.

In a further embodiment, the present invention provides the use of paroxetine or physiologically acceptable salts or solvates thereof and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof in the manufacture of a therapeutically effective medicament for simultaneous or sequential administration for the treatment and/or prophylaxis of depression and/or anxiety.

In a further preferred embodiment, the present invention provides the use of a therapeutically non-effective dose of paroxetine or physiologically acceptable salts or solvates thereof and a therapeutically non-effective dose of 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or a physiologically acceptable salts or solvates thereof, in the manufacture of a therapeutically effective medicament for simultaneous or sequential administration for the treatment and/or prophylaxis of depression and/or anxiety.

In a further preferred embodiment, the present invention provides the use of a therapeutically non-effective dose of paroxetine and a therapeutically non-effective dose of 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine dihydrochloride in the manufacture of a therapeutically effective medicament for simultaneous or sequential administration for the treatment and/or prophylaxis of depression and/or anxiety.

In a further preferred embodiment, the present invention provides the use of a therapeutically non-effective dose of paroxetine hydrochloride and a therapeutically non-effective dose of 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine dihydrochloride in the manufacture of a therapeutically effective medicament for simultaneous or sequential administration for the treatment and/or prophylaxis of depression and/or anxiety.

In a further preferred embodiment, the present invention provides the use of a therapeutically non-effective dose of paroxetine hydrochloride hemihydrate and a therapeutically non-effective dose of 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine dihydrochloride in the manufacture of a medicament for simultaneous or sequential administration for the treatment and/or prophylaxis of depression and/or anxiety.

In a further preferred embodiment, the present invention provides the use of a therapeutically non-effective dose of paroxetine hydrochloride anhydrate and a therapeutically non-effective dose 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine dihydrochloride in the manufacture of a therapeutically effective medicament for simultaneous or sequential administration for the treatment and/or prophylaxis of depression and/or anxiety.

In a further preferred embodiment, the present invention provides the use of a therapeutically non-effective dose of paroxetine mesylate and a therapeutically non-effective dose of 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine dihydrochloride in the manufacture of a therapeutically effective medicament for simultaneous or sequential administration for the treatment and/or prophylaxis of depression and/or anxiety.

The ratio of paroxetine or physiologically acceptable salts or solvates thereof to 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, in the composition according to the invention may be for example, from 1:5 to 10: 1 (measured by weight of the free bases).

5

Unless otherwise indicated, all weights of active ingredients are calculated in terms of the drug *per se*. The desired dose may preferably be presented as one, two, three, four, five, six or more sub-doses administered at appropriate intervals throughout the day.

- 10 The components of the combination which may be referred to as active ingredients may be administered for therapy to an animal e.g. a mammal, including a human, in a conventional manner.

- 15 While it is possible for the active ingredients of the combination to be administered as the raw chemical, it is preferable to present them as a pharmaceutical formulation. Pharmaceutical formulations according to the present invention comprise a combination according to the invention together with one or more pharmaceutically acceptable carriers or excipients and optionally other therapeutic agents. The carrier(s) must be acceptable in the sense of being compatible with the other ingredients of the formula and not deleterious to the recipient thereof. When the individual components of the combination are administered separately, they are generally each presented as a pharmaceutical formulation. The references hereinafter to formulations refer, unless otherwise stated, to formulations containing either the combination or a component thereof.

- 20 25 A combination of paroxetine or physiologically acceptable salts or solvates thereof and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, may conveniently be presented as a pharmaceutical formulation in a unitary dosage form.

- 30 35 Pharmaceutical formulations are often prescribed to the patient in "patient packs" containing the whole course of treatment in a single package, usually a blister pack. Patient packs have an advantage over traditional prescriptions, where a pharmacist divides a patient's supply of a pharmaceutical from a bulk supply, in that the patient always has access to the package insert contained in the patient pack, normally missing in traditional prescriptions. The inclusion of a package insert has been shown to improve

patient compliance with the physician's instructions and, therefore, lead generally to more successful treatment.

5 It will be understood that the administration of the combination of the invention by means of a single patient pack, or patient packs of each formulation, containing within a package insert instructing the patient to the correct use of the invention is a desirable additional feature of this invention.

10 According to a further aspect of the invention provided is a multiple, for example, double or triple, pack comprising at least paroxetine or physiologically acceptable salts or solvates thereof and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, and an information insert containing directions on the use of the combination of the invention.

15 Formulations include those suitable for oral, rectal, nasal, topical (including transdermal, buccal and sublingual), vaginal or parenteral (including subcutaneous, intramuscular, intravenous and intradermal) administration. The formulations may conveniently be presented in unit dosage form and may be prepared by any methods well known in the art of pharmacy. Such methods represent a further feature of the present invention and
20 include the step of bringing into association the active ingredients with the carrier which constitutes one or more accessory ingredients. In general, the formulations are prepared by uniformly and intimately bringing into association the active ingredients with liquid carriers or finely divided solid carriers or both, and then if necessary shaping the product.

25 Formulations of the present invention suitable for oral administration may be presented as discrete units such as capsules, caplets, cachets or tablets each containing a predetermined amount of the active ingredients; as a powder or granules; as a solution or a suspension in an aqueous or non-aqueous liquid; or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion. The active ingredient may also be presented as a bolus,
30 electuary or paste.

A tablet may be made by compression or moulding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active ingredients in a free-flowing form such as a powder or granules, optionally
35 mixed with a binder (e.g. povidone, gelatin, hydroxypropylmethyl cellulose), lubricant, inert diluent, preservative, disintegrant (e.g. sodium starch glycolate, sodium croscarmellose

cross-linked povidone, cross-linked sodium carboxymethyl cellulose) surface-active or dispersing agent. Molded tablets may be made by molding a mixture of the powdered compound moistened with an inert liquid diluent in a suitable machine. The tablets may optionally be coated or scored and may be formulated so as to provide slow or controlled
5 release of the active ingredients therein using, for example, hydroxypropylmethyl cellulose in varying proportions to provide the desired release profile. Tablets may optionally be provided with an enteric coating, to provide release in parts of the gut other than the stomach.

10 Formulations suitable for topical administration in the mouth include lozenges comprising the active ingredients in a flavored base, usually sucrose and acacia or tragacanth; pastilles comprising the active ingredients in an inert basis such as gelatin and glycerin, or sucrose and acacia; and mouthwashes comprising the active ingredients in a suitable liquid carrier. Formulations for rectal administration may be presented as a suppository
15 with a suitable base comprising, for example, cocoa butter or polyethylene glycols.

Topical administration may also be by means of a transdermal iontophoretic device.

20 Formulations suitable for vaginal administration may be presented as tablets, pessaries, tampons, creams, gels, pastes, foams or spray formulations containing in addition to the active ingredients such carriers as are known in the art to be appropriate.

Pharmaceutical formulations suitable for rectal administration wherein the carrier is a solid are most preferably presented as unit dose suppositories. Suitable carriers include cocoa
25 butter and other materials commonly used in the art. The suppositories may be conveniently formed by admixture of the active combination with the softened or melted carrier(s) followed by chilling and shaping in molds.

30 Formulations suitable for parenteral administration include aqueous and nonaqueous isotonic sterile injection solutions which may contain anti-oxidants, buffers, preservatives and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents; and liposomes or other microparticulate systems which are designed to target the compound to blood components or one or more organs. The
35 formulations may be presented in unit-dose or multi-dose sealed containers, for example, ampoules and vials, and may be stored in a freeze-dried (lyophilized) condition requiring

only the addition of the sterile liquid carrier, for example water for injection, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules and tablets of the kind previously described.

- 5 It should be understood that in addition to the ingredients particularly mentioned above the formulations of this invention may include other agents conventional in the art having regard to the type of formulation in question, for example, those suitable for oral administration may include such further agents as sweeteners, thickeners and flavoring agents.

10

The pharmaceutical composition of the invention containing the two active ingredients may be prepared according to conventional techniques well known in the pharmaceutical industry. Thus, for example paroxetine or physiologically acceptable salts or solvates thereof and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, may be admixed together with suitable excipients such as those described above for the formulation of each of the active ingredients separately. Tablets may be prepared, for example by direct compression of such a mixture or using other conventional methods. Bilayer tablets may be prepared according to conventional procedure. Thus, for example, by separately compressing the two blends in a suitable tableting machine with two filling stations. Capsules may be prepared by filling the blend along with suitable excipients into gelatin capsules, using a suitable filling machine. Controlled release forms for oral or rectal administration may be formulated in a conventional manner associated with controlled release forms.

25

Biological data:

The advantageous profile of anti-anxiety activity obtained by the administration of a therapeutically non-effective dose of paroxetine or physiologically acceptable salts or solvates thereof with a therapeutically non-effective dose of 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, can be demonstrated in the gerbil social interaction model.

30

Experiment

35 Paroxetine hydrochloride hemihydrate (0.3 mg/kg p.o of the paroxetine measured as the free base), 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-

yl)-amine dihydrochloride(hereinafter compound A)(0.03 mg/kg i.p of the compound A measured as the free base) and a combination of paroxetine (0.3 mg/kg p.o. of the paroxetine measured as the free base) and compound A (0.03 mg/kg i.p. of the compound A measured as the free base) were administered independently in mongolian
5 gerbils to assess the effect on time spent in active social interactions.

The results obtained one hour after administration, expressed as a percentage variation of the time spent in active social interactions by each animal in respect to the value obtained by treatment of control animals, are summarised in table 1.

10

Table 1

	Paroxetine hydrochloride hemihydrate	Compound A	Combination of Paroxetine hydrochloride hemihydrate and Compound A
%Variation	-2%	+19.9%	+40.3%

The variation of the amount of time spent in active social interactions by each animal after treatment with a combination of paroxetine hydrochloride hemihydrate and compound A ,
15 is significantly greater than that expected from of the therapeutic response of the components administered separately.

Thus, the above results provide evidence for a synergistic effect between 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof and paroxetine or physiologically acceptable salts or
20 solvates thereof in a social stress assay.

Paroxetine as the free base or in the form of any physiologically acceptable salt thereof, including all hydrated or anhydrous forms and all polymorphic forms of such salts may be prepared by the method described in USP 4,007,196, EP-B-0223403, EP-B-0808314 and
25 EP-B-0970955 which are incorporated herein by reference hereto.

2-Methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, may be prepared by the method described in WO 95/08549 which is incorporated herein by reference.

30

For co-administration, paroxetine or physiologically acceptable salts or solvates thereof and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, may be formulated in a conventional manner.

5

Thus, for example paroxetine or physiologically acceptable salts or solvates thereof may be formulated as described in USP 4,007,196, EP-B-0223403, EP-B-0808314 and EP-B-0970955 and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, may be formulated as

10

In a preferred aspect of the invention, paroxetine or physiologically acceptable salts or solvates thereof and 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof, are formulated in a single pharmaceutical composition.

15

In order that this aspect of the invention may be more fully understood the following examples are given by way of illustration only.

20

In the following pharmaceutical formulation Compound A refers to 2-methoxy-5-(5-trifluoromethyl-tetrazol-1-yl-benzyl)]-(2S-phenyl-piperidin-3S-yl)-amine or physiologically acceptable salts or solvates thereof; Compound B refers to paroxetine or physiologically acceptable salts or solvates thereof

25

Tablets

Tablets may be prepared by the normal method such as direct compression or wet granulation.

The tablets may be film coated with a suitable film forming material such for example Opadry using standard technique.

30

Example 1

Direct compression

Tablets

Compound A (as dihydrochloride salt)	4 mg (measured as the free base)
------------------------------------------------	----------------------------------

Compound B (as hydrochloride hemihydrate salt)	7.5 mg(measured as the free base)
Dibasic Calcium Phosphate	109.75 mg
Mg stearate	1.5 mg
Crospovidone	4.5 mg
Colloidal Silicon Dioxide:	0.75 mg

Compound A , Compound B, dibasic Calcium Phosphate, Crospovidone, Colloidal Silicon Dioxide and Magnesium stearate are mixed together and the resultant mix is compressed into tablets using suitable machine so as to provide tablets according to example 1

5

Example 2

Wet granulation

Compound A (as dihydrochloride salt)	4 mg (measured as the free base)
Compound B (as hydrochloride hemihydrate salt)	7.5 mg(measured as the free base)
Microcrystalline cellulose	106.75 mg
Mg stearate	1.5 mg
Crospovidone	4.5 mg
Colloidal Silicon Dioxide	0.75 mg
Polyvinylpyrrolidone	3 mg

The compound A is mixed with Microcrystalline cellulose, Polyvinylpyrrolidone and Crospovidone then granulated with a suitable amount of water. After drying the granule, the compound B and Colloidal Silicon Dioxide are added to it and mixed for a suitable time. The resulting mixture was blended with Mg stearate and then compressed into tablets as described in Example 1.

15

Example 3

Wet granulation

Compound A	4 mg (measured as the free base)
-------------------	----------------------------------

(as dihydrochloride salt)	
Compound B (as hydrochloride hemihydrate salt)	7.5 mg(measured as the free base)
Microcrystalline cellulose	106.75 mg
Mg stearate	1.5 mg
Crospovidone	4.5 mg
Colloidal Silicon Dioxide:	0.75 mg
Polyvinylpyrrolidone	3 mg

The compound B is mixed with Microcrystalline cellulose, Polyvinylpyrrolidone and Crospovidone then granulated with a suitable amount of water. After drying the granule, the compound A and Colloidal Silicon Dioxide are added to it and mixed for a suitable time. The resulting mixture was blended with Mg stearate and then compressed into tablets as described in Example 1.

Example 4

co Wet granulation

Compound A (as dihydrochloride salt)	4 mg (measured as the free base)
Compound B (as hydrochloride hemihydrate salt)	7.5 mg(measured as the free base)
Microcrystalline cellulose	106.75 mg
Mg stearate	1.5 mg
Crospovidone	4.5 mg
Polyvinylpyrrolidone	3 mg

The compound B and the compound A are mixed with Microcrystalline cellulose, Polyvinylpyrrolidone and Crospovidone then granulated with a suitable amount of water. After drying the granule, Mg stearate is added to it, blended and the resulting mixture compressed into tablets as described in Example 1.

Example 5

Dry granulation

Compound A (as dihydrochloride salt)	4 mg (measured as the free base)
Compound B (as hydrochloride hemihydrate salt)	7.5 mg(measured as the free base)
Microcrystalline cellulose	106.75 mg
Mg stearate	1.5 mg
Crospovidone	4.5 mg
Colloidal Silicon Dioxide:	1 mg
Polyvinylpyrrolidone	2 mg

- The compound B and the compound A are mixed with Microcrystalline cellulose, Mg stearate, Crospovidone, Colloidal Silicon Dioxide and Polyvinylpyrrolidone. The resulting mixture is compressed with flat faced punches so as to provide slugs which fall into a mill so as to obtain granular particles. The granule is then compressed into tablets as described in example 1.

Pellets

Example 6

Extrusion-Spheronization

Compound A (as dihydrochloride salt)	4 mg (measured as the free base)
Compound B (as hydrochloride hemihydrate salt)	7.5 mg(measured as the free base)
Cellulose Spheres*	112 mg
Polyvinylpyrrolidone	4.5 mg

* Microcrystalline cellulose (Avicel)

- 10 The compound B, after being mixed into the granulator chamber with microcrystalline cellulose, is wetted under agitation by spraying a suitable amount of water; the resulting wetted mass is extruded through a screen with proper dimensions so as to provide cylindrical extruded particles which are converted into pellets by the mechanical action of the rotating plate of a spheronizator. The pellets are dried and then encapsulated together
- 15 with the compound A pellets produced applying the same process.

Alternatively, the compound B, after being mixed into the granulator chamber with microcrystalline cellulose is wetted under agitation by spraying a suitable amount of water;

the resulting mixture is agitated in order to let its particles growing up to pellets. The pellets are dried and then encapsulated together with the compound A pellets produced applying the same process.

- 5 Alternatively, a suitable amount of inert cellulose pellets are put in the fluid bed granulation chamber and set in motion introducing air at the bottom and then coated by spraying a water solution of the compound B. Pellets are dried and then encapsulated together with the compound A pellets produced applying the same process.
